

PyMol Tutorial

What are we going to cover

- Brief overview of the program
- Quick introduction to the basic features

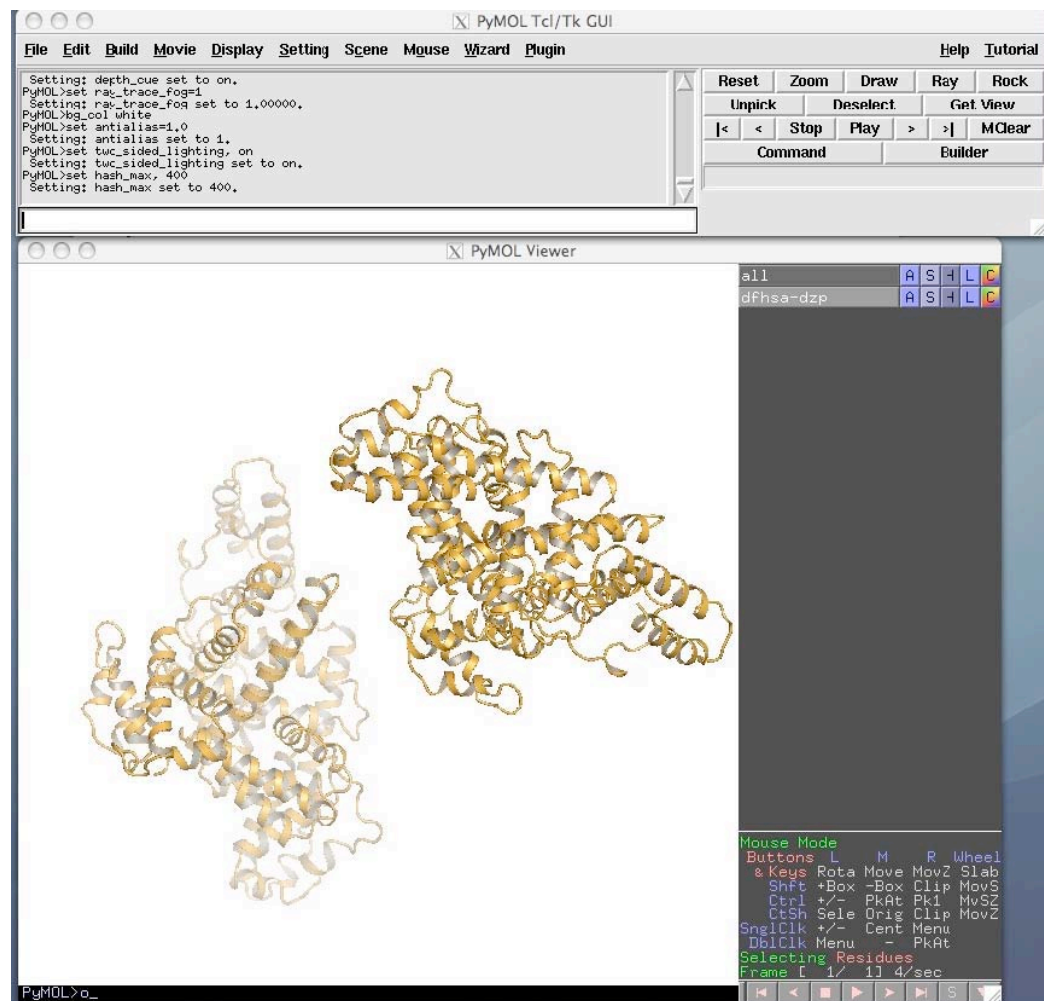

- Just enough to get you started ...
- You need to spend “hands on” time getting to know the program

Introduction to PyMol

- What is pymol for?
 - Looking at pdb files (protein, nucleic acid, ligands, etc.)
 - Making publication quality figures (of models and maps)
 - NOT for model building
- Where can I get it?
 - pymol.sourceforge.net
 - Current version: 0.99
 - pymol.sourceforge.net/html/ -for the manual
- Other important links
 - www.rcsb.org Protein data bank
 - 144.16.71.146/rp Ramachandran plotting tool
 - www.igs.cnrs-mrs.fr/Caspr2/RMSDcalc.cgi Structure alignment site (RMSD calc)

Starting the program

- Locate the application icon and click on it.
 - For windows users look under the program files section of the windows start menu
 - Use the PyMol + Tck-TK GUI +console icon
 - You should see a command window and a graphics window

Part 1 – loading, moving and displaying

- How do I?
 - Load a pdb file
 - Change display settings
 - Create an object
 - Use the mouse to move, zoom, slab, rotate
 - Use the object menus: A, S, H, L, C
 - Navigate contextual menus
 - Display the sequence
 - Select residues
 - Save my work

How do I load a PDB file

- Download a pdb file directly into pymol
 - Make sure you are connected to the internet
 - [Plugin > PDB loader service](#)
 - Typew in the PDB ID (e.g. 1AB9)
 - Object appears with this PDB ID
- Load a “local” pdb file
 - [File > Open ...](#)
 - Select a pdb file
 - Object appears with the same name as the pdb file

Useful display settings

- **Display > Background > white** --- set the background colour
- **Display > orthoscopic view** --- no perspective distortion

Creating new objects

- To create an object containing just chain A of 1AB9

– Type in command (or graphics window):

create D, (1AB9 and c;d)

Using the mouse in the graphics window

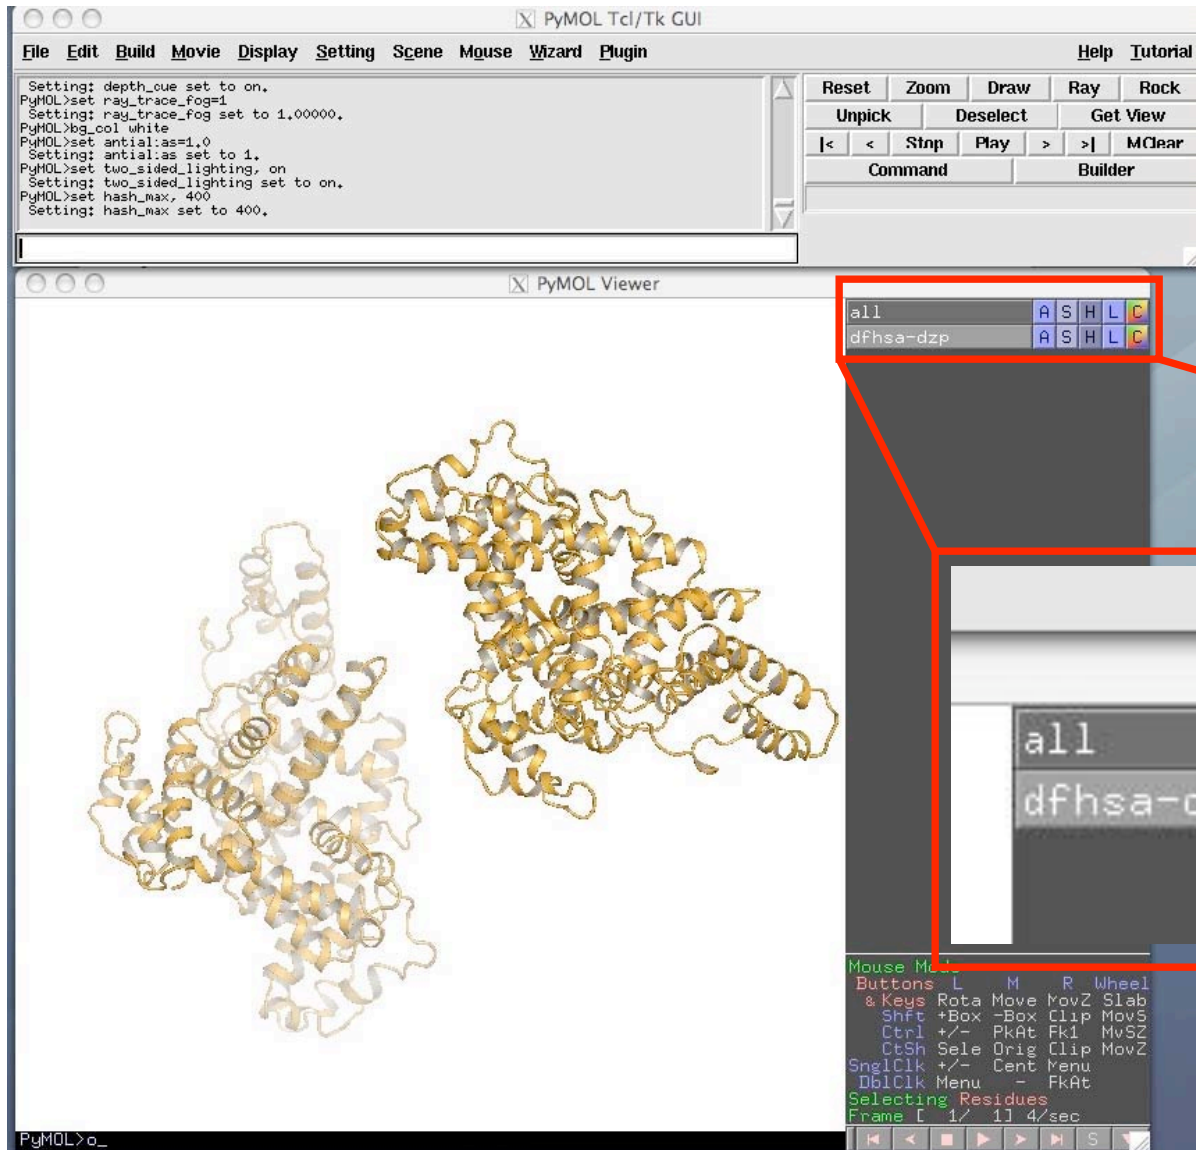

- **Unmodified controls**
 - Left – rotate molecule (x, y and, at edges, z)
 - Middle – translate molecule (x, y)
 - Right – zoom (= Move Z)
 - Wheel – slab/clip
- **With shift key**
 - Right
 - up/down: clip front
 - left/right: clip back

Menu at bottom right

```
Mouse Mode
Buttons  L      M      R      Wheel
& Keys  Rota  Move  MovZ  Slab
Shft    +Box -Box  Clip  MovS
Ctrl    +/-  PkAt  Pk1   MvSZ
CtSh    Sele  Orig  Clip  MovZ
SnglClk +/-  Cent  Menu
Db1Clk  Menu  -     PkAt
Selecting Residues
Frame [ 1/ 1] 18/sec
```

Object menus: A, S, H, L, C

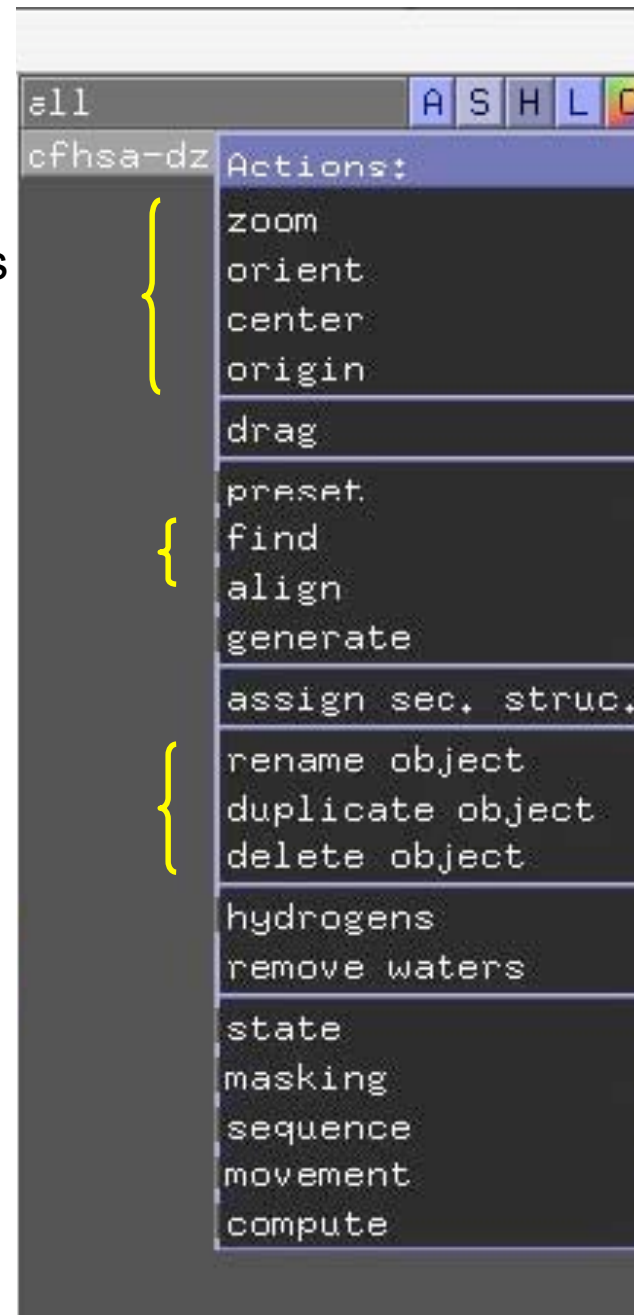

A is for Action

Navigation Tools

Analysis tools

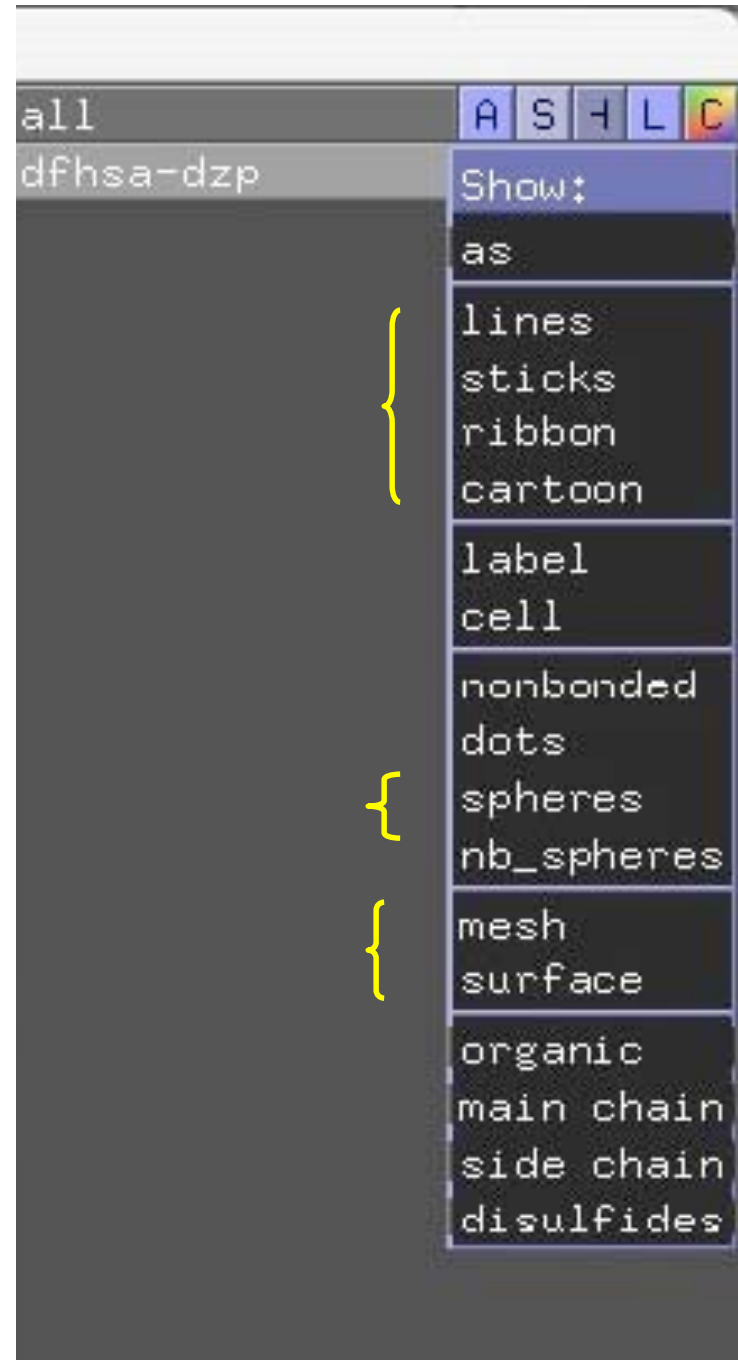

Object manipulation

NB: some of these have sub-menus

S is for Show

Useful representations

H is for Hide

Same content as Show menu

Use Show and Hide to toggle things on and off

L is for Label

Useful for keeping track of key residues

C is for Color

Lots of options

Mostly self-explanatory

Color menu gives names
of ready-made colors that can be
used in scripts

Display the sequence

```
PyMOL Viewer
/hsa-a/A/A/5      11  16  21  26  31  36  41  46  51  56  61  66
SEVAHRFKDLGEENFKALVLI AFAQYLQQCPFEDHVKLVNEVTEFAKTCVADESAENC DKSLH
all              A S H L C
2BHG             A S H L C
dfhsa-dzp       A S H L C
```

From menu:
Display > sequence

Or

Click on "S" in the
mouse menu

Use the sequence to
Select residues for
Modification

Access menus from the
sequence

```
Mouse Mode
Buttons L M R Wheel
& Keys Rota Move MovZ Slab
Soft +Box -Box Clip MovS
Ctrl +/- PKAt PK1 MvSZ
CtSh Sele Orig Clip MovZ
SnglClk +/- Cent Menu
Db1Clk Menu - PKAt
Selecting Residues
Frame [ 1/ 1] 18/sec
```

```
Mouse Mode
Buttons L M R Wheel
& Keys Rota Move MovZ Slab
Sh-t +Box -Box Clip MovS
Ct-1 +/- PKAt PK1 MvSZ
CtSh Sele Orig Clip MovZ
SnglClk +/- Cent Menu
Db1Clk Menu - PKAt
Selecting Residues
Frame [ 1/ 1] 22/sec
```

PyMOL>_

Contextual menus

- Left double click or right single click to activate
 - Click on an object or part of an object you want to manipulate
 - More or less the same menus as ASHLC

The screenshot shows the PyMOL Viewer interface. A protein structure is displayed in the center, with a contextual menu open over a specific residue. The menu is divided into several sections:

- Object Selection:** atom, residue, chain, segment, object, molecule, fragment, fragment+joint(s)
- Manipulation:** zoom, orient, center, origin, select, drag, masking, movement, remove atoms, create object
- Coloring:** Chain, color, show, hide, preset, label, zoom, orient, center, origin, select, drag, masking, movement, remove atoms, create object
- Color Options:** Color:, by element, by chain, by ss, spectrum, auto, reds, greens, blues, yellows, magentas, cyans, oranges, tints, grays
- Spectrum:** Spectrum:, rainbo (e, c), rainbo (* /ca), rainbo
- b-factors:** b-factors, b-factors(* /ca)
- Mode:** Mode, s L M R Wheel, Rota Move MovZ Slab, +Box -Box Clip MovS, +/- PkAt Pk1 MySZ, Sele Orig Clip MovZ, +/- Cent Menu, Menu PkAt
- ng Residues:** ng Residues
- Frame:** Frame [1 / 1] 1/sec

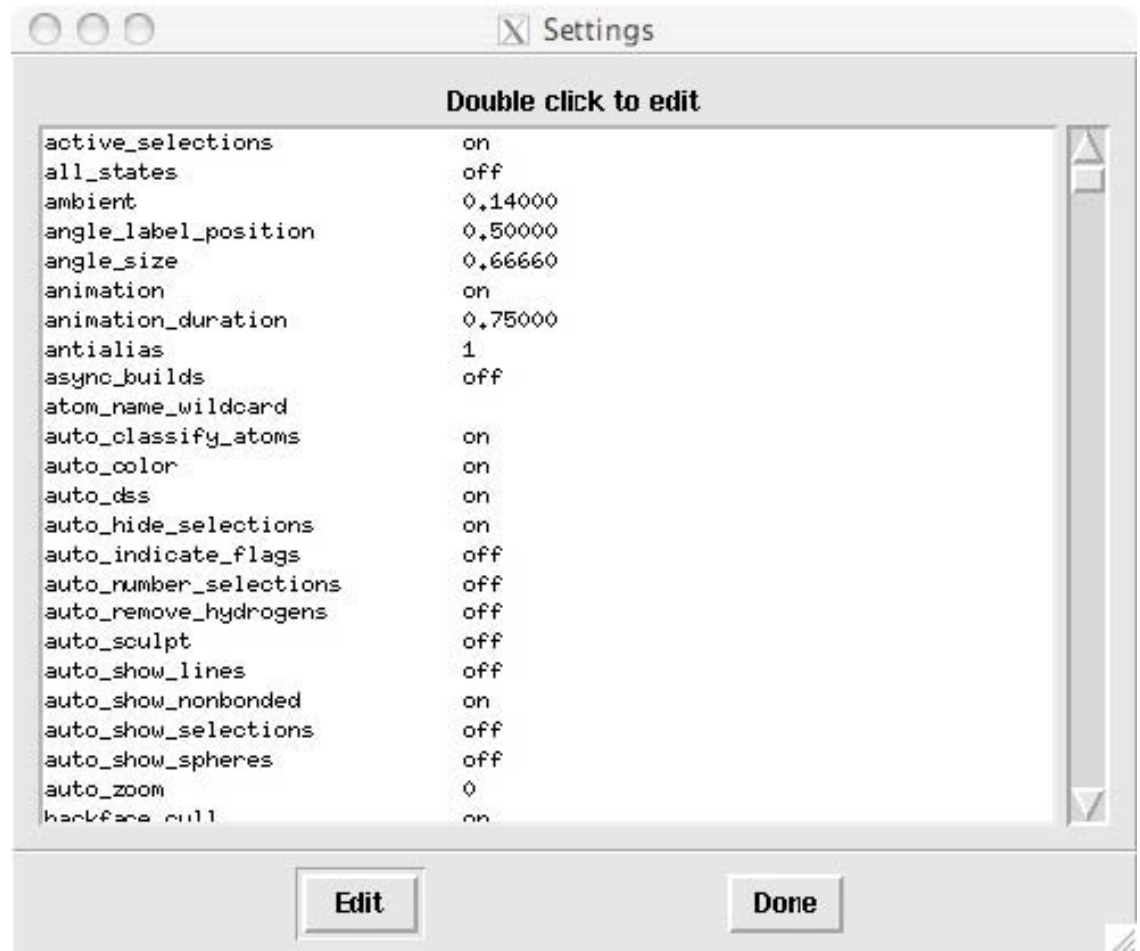

The PyMOL command line at the bottom shows the prompt `PyMOL>_`.

The Settings menu

Settings > edit all ...

Lots of options!

Make educated guesses
and see what happens

Saving your work

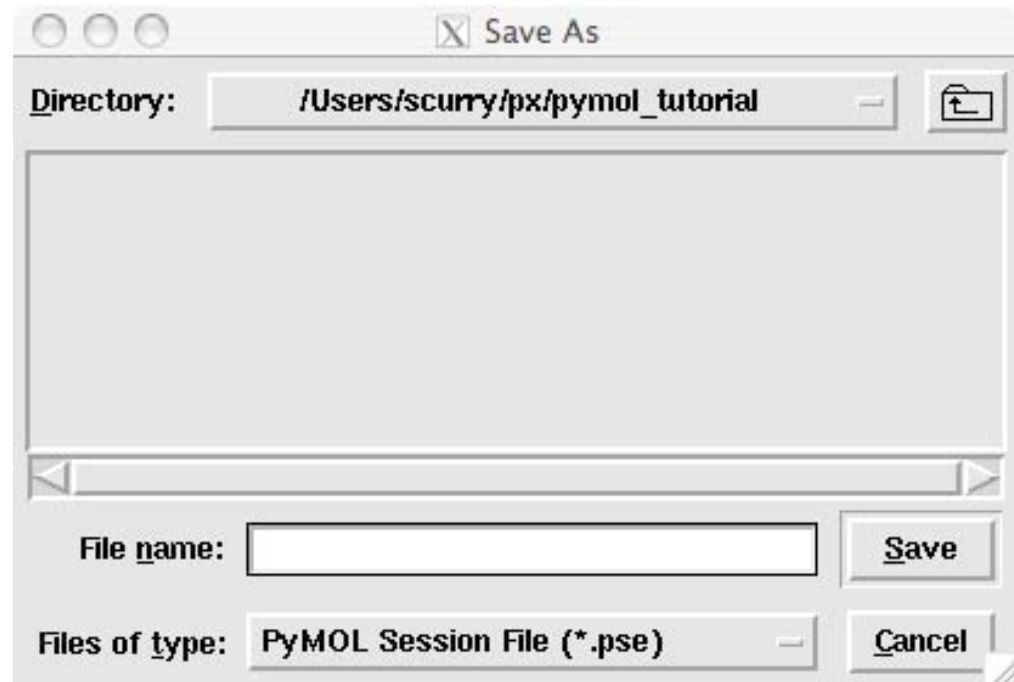

File > save session ...

Enter filename as “file.pse”

Will save all your current settings
(display objects, maps, etc.)

When you return to PyMol, load
this file:

File > Open

Part 2 – Structural analysis

- Selection syntax
- Displaying Biochemical Properties
 - Selecting secondary structures
 - Calculating dihedral angles
 - Polar Contacts and Hydrogen-bonding
- Alignment of two or more structures

Selection syntax

resi 99-105 residues 99-105 inclusive
(i;99:105) (i = residue id number)

resn tyr	all Tyrosine residues
(r;tyr)	(r = residue name)
resn tyr or resn phe	all tyr and phe residues
r;tyr+phe	all tyr and phe residues

Chain A	chain A
(c;a)	(c = chain)

Name N	all atoms named "N" (=main-chain nitrogen)
(n;N)	(n = atom name)
(n;CA)	all atoms named "CA" (=alpha carbon)
	(get to know the atom names in pdb files)
(n;c+o+n+ca)	all backbone atoms
(n;c,o,n,ca)	all backbone atoms

Elem C	all carbon atoms
(e;C)	(e = element)

Selection Algebra

Operator	Short Form	Effect
not s1	!s1	Selects atoms that are not in object s1
s1 and s2	s1 & s2	Selects atoms included in both s1 and s2
s1 or s2	s1 s2	Selects atoms included in either s1 or s2
s1 around X	s1 a. X	Selects atoms with centers within X Angstroms of the center of any atom in s1
s1 expand X	s1 e. X	Expands s1 by all atoms within X Angstroms of the center of any atom in s1
s1 within X of s2	s1 w. X of s2	Selects atoms in s1 that are within X Angstroms of s2
neighbor s1	nbr. s1	Selects atoms directly bonded to s1

Atom Selection Macros

- Macros make it possible to represent a long atom selection phrase such as:

select 1AB9 and segi PROB and chain B and resi 35 and name ca

In a more compact form

select /1AB9/PROB/b/35/ca

/object-name/segi-identifier/chain-identifier/resi-identifier/name-identifier

If you do not need one to these identifiers, just leave that space blank

select /1AB9//b/35/ca

Displaying Biochemical Properties

- Selecting secondary structures
 - Select helix, (ss h)
 - Select sheet, (ss s)
 - Select loop, (ss l+''')
- Manually assigning secondary structure
 - alter 11-40/, ss='S'
 - alter 11-40/, ss='H'
 - alter 11-40/, ss='L'

to set residues 11-40 to beta strand, alpha helix, and loop respectively

Measurement Wizard

wizard > measurement

- Pretty much self explanatory
- Select measurement mode from pull-down menu
- Use the mouse to pick the atoms involved in the distance, angle or torsion angle you are interested in as prompted in the upper left hand corner of the graphics window
- When finished, click done

Calculating dihedral angles

- The `get_dihedral` function requires four single-atom selections to work:

```
get_dihedral 1AB9//B/16/c,1AB9//B/17/n, 1AB9//B/17/ca,  
1AB9//B/17/c
```

Returns the phi angle for residue 17 in chain B of 1AB9

For the psi angle you would use N_i, CA_i, C_i, N_{i+1}

```
get_dihedral 1AB9//B/17/n,1AB9//B/17/ca, 1AB9//B/17/c,  
1AB9//B/18/n
```

- Alternatively you can use the measurement tool under the wizard tab and manually select the four atoms involved in each dihedral

Polar Contacts

- Using the PyMol menus one may display Polar Contacts. These are defined as

```
set h_bond_cutoff_center, 3.6
```

with ideal geometry and

```
set h_bond_cutoff_edge, 3.2
```

with minimally acceptable geometry

- These settings can be changed *before* running the detection process

Hydrogen-bonding

- Easy Hydrogen Bonds

dist name, s1, s2, mode=2

- More complicated Hydrogen Bonds –

h_add 1AB9

select protein, chain A or chain B or chain C

select substrate, chain D

select don, (elem n+o and (neighbor hydro))

select acc, (elem o or (elem n and not (neighbor hydro)))

dist HBA, (substrate and acc), (protein and don), 3.2

dist HBD, (substrate and don), (protein and acc), 3.2

delete don

delete acc

hide (hydro)

Structural Alignment

- Requires at least 2 structures to be loaded into pymol

`align 1NES, 1AB9`

- PyMol will first do a sequence alignment and then try to align the structures to minimize the RMSD between the aligned residues
- When the alignment runs it will print out some information:

Match: read scoring matrix.

Match: assigning 388 x 370 pairwise scores.

MatchAlign: aligning residues (388 vs 370)...

ExecutiveAlign: 1393 atoms aligned.

ExecutiveRMS: 68 atoms rejected during cycle 1 (RMS=2.34).

ExecutiveRMS: 82 atoms rejected during cycle 2 (RMS=1.41).

Executive: RMS = 1.095 (1243 to 1243 atoms)

- Restricting the alignment

- Alignment of just the backbone atom

`align 1NES and name n+ca+c+o, 1AB9 and name n+ca+c+o`

- For more difficult alignments try RMSD calc website
